

Programed Instruction in West-Germany

-- Development and Present State --

by

Ludwig J. Issing
Wurzburg Institute of Psychology
Wurzburg, Germany

Programed instruction is without doubt an "invention" of American Psychology. In the meantime, however, this new teaching and learning method has been picked up and further developed in many other countries, too. The development of programed instruction (PI) in West-Germany has to receive special attention since the center of European PI-research lies in Germany. This fact has been affirmed by Prof. G. R. Boulanger (Brussels) in the IV. Symposium on teaching machines, Dusseldorf, March, 1966.

I. Development of Programed Instruction in West-Germany

In 1960, when there already existed in the USA a considerable number of workable programs and functioning teaching machines, little was known in Germany about the principles and techniques of programed learning. In 1962/63 the first articles by German authors appeared in psychological and educational journals; these, however, were written for the main part in quite polemic fashion. Titles like "Mechanization of Instruction through Teaching Machines?", "Machine or Teacher?", "Nuremberger Trichter (royal road to learning) — made in USA", etc., were no exception. Such articles were a defense reaction of frightened teachers, who feared lest automation enter the "holy halls" of education. During that time the publications showed hardly any real understanding of the psychological principles underlying PI.

The situation changed radically with the First Nurtinger Symposium (March 1963) and the Congress on Programed Learning, which was held in Berlin, July 1963. At this congress in Berlin, for the first time, a large group of German psychologists and educators became acquainted with the scientific

fundamentals of PI, as explained by prominent American professors like E. R. HILGARD and W. SCHRAMM.

After this congress in Berlin the number of publications on PI rose drastically. The number of publications —being in 1960 one, in 1961 three, and in 1962 twelve — rose to ninety in 1963. Two journals were founded which were dedicated solely to the development and research of PI: "Deutsche Lehrprogramme fur Schule und Praxis" (1963), Manz Verlag, Munchen, and "Programmiertes Lernen und Programmierter Unterricht" (1964), Cornelsen Verlag, Berlin; additionally an information brochure: "Mitteilungen über Programmierte Instruktion" (1963), Buro Dr. Deutsch, Darmstadt.

Imitating the development in the USA, industrial firms in Germany expected to make considerable profits through the propagation of PI. Teaching machines were produced in numerous makes, though there existed at that point no original German programs. One had to be content with translations from English. Not before 1964 were the first German programs and text books commercially available.

Publications under the topic of PI began to show the features of objective scientific reports. If PI was once rejected with spontaneous hostility, it was now accepted with almost exaggerated enthusiasm. A general open-mindedness toward experimenting with programed learning could not be overlooked. Research programs in the area of PI were started by more than 30 institutions mainly concerned with: a) basic research, and b) the development and evaluation of programs. A great number of these programs are still being continued under the aid of Deutsche Forschungsgemeinschaft and Stiftung Volkswagenwerk. The following list shows the most important institutions, working in the area of PI:

List of Institutions working in the Area of PI:
Institut fur Erziehungswissenschaft
an der Technischen Hochschule Aachen
Padagogische Hochschule Alfeld

Institut fur Kybernetik an der Padagogischen Hochschule	Berlin	
Institut fur padagogische Psychologie Hochschule	Berlin	
Psychologisches Institut der Universitat	Bochum	
Technische Hochschule	Darmstadt	
Deutsches Institut fur Internationale Padagogische Forschung	Frankfurt am Institut fur Programmiertes Lernen	Giessen
Arbeitskreis Padagogischer Hochschulen	Gottingen	
Padagogisches Seminar der Universitat	Gottingen	
Erziehungswissenschaftliches Seminar der Universitat	Hamburg	
Arbeitskreis zur Forderung u. Pflege wiss. Methoden des Lehrens u.		
Lernens, e. V.	Heidelberg	
Odenwaldschule	Heppenheim/Bergstr.	
Forschungsgruppe fur Programmiertes Lernen, e. V.	Koln	
Padagogische Arbeitsstatte	Munchen	
Padagogische Hochschule	Oldenburg	
Padagogische Hochschule	Osnabruck	
Padagogisches Seminar der Universitat	Tubingen	
Psychologisches Institut (I)		
der Universitat	Wurzburg	
Psychologisches Institut (II)		
der Universitat	Wurzburg	

In January 1966, about 36 German programs were commercially available. Besides that, however, an uncontrollable number of dittoed programs existed. The following list shows how the programs commercially available are distributed over specific subjects:

subject	number of German programs
1. Mathematics	15
2. Metallurgy	4
3. Bookkeeping	3
4. Programed Instruction	3
5. Programing (techniques)	2
6. Biology	2
7. Geography	1
8. Physics	1
9. Electronics	1
10. Counseling	1
11. Professional training	1
12. Others (e.g. Chess)	2
Sum:	36

In connection with the development of PI in Germany the name of Prof. Dr. Helmar FRANK has to be mentioned. FRANK is head of the newly founded Institute for Cybernetics at the Padagogische Hochschule Berlin. Under his direction the well known Nurtinger Symposia on teaching machines (1963, 1964, 1965, 1966) have

been held. These symposia were primarily concerned with specific programming variables as well as techniques of preparing a subject matter for computer programming. Meanwhile the symposia on teaching machines have become a permanent establishment and have acquired an almost international character. This has been shown by the great number of representatives from various countries who attended the IV. Symposium on Teaching Machines, Dusseldorf 1966. They included STOLUROW (USA), LANDA (USSR), BOULANGER (Belgium), PERRIAULT (France), BUNG (Great Britain), BIERSTEDT (Sweden), KUBALEK (CSSR) and others.

Since the last convention on PI it became clear that the German PI-research has reached the state of foreign development, but it also became clear that the problems, hypotheses, and research methods used in Germany are different from those in other countries.

II. The Characteristics of the PI— Praxis and Research in Germany

The basis for PI-research in Germany is American PI-literature, especially as far as it is available in translation (CRAM,D.,1965; FOLTZ,Ch.I., 1965; MAGER,R.F.,1965; CORRELL, W.,1965— collection of papers by S.L. PRESSEY, B.F.SKINNER, J.C.HOLLAND et al.; SCHRAMM,W.,1966; LY- SAUGHT,J.P., 1967; GLASER,R., 1967, in preparation; and others). A great number of German educators stick to the principle that American methods and results must not be taken over uncritically. They constantly direct attention to the long tradition of German pedagogy and to the obligation not to neglect culture and education beside mere instruction (e.g. NETZER,H., 1964; ZIELINSKI,J. and SCHOLER,W., 1965). In school education the programmed instruction is clearly assigned its serving function. The mediating role of the teacher is emphasized. One asks whether programmed instruction can lead the learner not only to mere reception of knowledge, but also to creative thinking (CORRELL,W., 1965; BARTMANN, TH., 1966). B. F. SKINNER on the occasion of his lecture at Giessen, February 1966, answered this question in the affirmative sense,

though he failed to show definite ways toward this goal.

At the IV. Symposium on teaching machines (1966) two camps of the convention participants could be distinguished: the practitioners and the theoreticians.

The **practitioners**—for the main part teachers in public and private schools, in adult education and in professional training, in industrial and economic training centers—have recognized the advantages of PI and demand as a consequence usable teaching programs and presenting devices. But since those are not commercially available to a satisfying extent, the practitioners take their own initiative and sometimes produce material which is not justified from the scientific point of view.

The **theoreticians**, on the other hand, criticize these products hand-made by the practitioners; for scientifically justified programming is impossible without exact basic research. This basic research has its fundamental origin in Cybernetics and information theory (CUBE,F.v.,1965; FRANK,H.,1963, 1964, 1965; ENGLERT,L.,1966). Before programming a subject matter its algorithm has to be worked out. The methods of algorithmizing a subject matter have been promoted in Germany through the works done by LANDA,L.N.(1963) and FRANK,H. (1964, 1965, 1966). Further development in this area is a necessary condition for an organized use of computers in instruction. At the present point computer-aided programs are being used for instruction and practical training only at research institutes (e.g. Institute for Cybernetics in Berlin) and in industrial firms (e.g. IBM at Sindelfingen). As in the USA, one hopes also in Germany to be able to use computer-aided programs for regular instruction for the future even in universities and schools through the installment of centralized computer systems.

At the present time programmed instruction is generally being performed at German schools in the form of programmed booklets. These are constructed, for the main part, according to the linear model (SKINNER).

Of the mechanical and electro-mechanical devices produced by German

firms, some are built in license received by American firms; some, however, have been developed in Germany. The most famous teaching machine of the latter kind is the PROBITON—apparatus by Prof. J. ZIELINSKI and W. SCHOLER (Aachen). This device permits the presentation of a program—consisting of a program text, picture illustrations, and sound recordings. Another device, the ROBIMAT developed by Prof. H. FRANK and R. KISTNER (Berlin, 1965) gives each student the possibility to answer questions of the teacher with "Yes" or "No" by pressing one of two keys, whereafter a light signal informs him immediately about the correctness of his answer. A similar device has been constructed by DOBRINSKI (1965); his apparatus, however, has an advantage compared to the ROBIMAT because the teacher is able to check the percentage of "Yes" — and "No" — answers of his class to a given question on a special recording instrument. BOLKOW, a West-German firm is working on a mechanical device, called DIATON, which is said to allow the presentation of fully-branched audio-visual programs.

The most technical perfection has been achieved till now, undoubtedly, in the area of audio-visual laboratories. The establishment of A-V-labs is being promoted especially at high schools, since instruction in at least two foreign languages is a major teaching goal in German high school education. The courses are being performed according to the principles of programmed learning. Sound, text, and illustrations are used to help the student. Teaching programs for foreign language instructions are constantly revised and improved.

It can be seen that the once exaggerated enthusiasm for PI is now giving way to a critical, objective discussion. At colleges, students get acquainted with this new method of instruction; experiments and studies in the use of PI in schools are supported. For a large scale use of PI in education, however, the small number of tested programs is problematic. Looking at the present situation, it can be concluded that it will take at least ten years until the German schools will take profit of the advantages of PI to a large extent.

A one week Instructional Technology Workshop will be offered during the week of July 24, by General Programmed Teaching of Palo Alto, California. The workshop will be held at the Lincolnwood Hyatt House in Chicago.

The course instructor will be Dr. W. A. Deterline. The workshop itself is programmed, including programmed lectures and demonstrations, programmed audiovisual units, and programmed text exercises.

The registration fee is \$275. Information regarding course objectives, registration, etc., can be obtained by writing Dr. Deterline at General Programmed Teaching, 424 University Avenue, Palo Alto, California, 94301.

—o—
A new educational system is being developed which uses the computer as an aid to the teacher in providing each student with an individual program of study, tailored to his needs, abilities and objectives.

The system, called Project PLAN (Program for Learning in Accordance with Needs), will be introduced this fall in twelve school districts in New York, California, Massachusetts, Pennsylvania and West Virginia.

Announcement of Project PLAN was made today by Donald H. McGannon, Chairman of the Westinghouse Learning Corporation and

News Releases

John C. Flanagan, Chairman of the American Institutes for Research in the Behavioral Sciences (A.I.R.), who said support and financing for the project is being provided by Westinghouse Learning, A.I.R., and the participating school districts.

To achieve the aims of the system, student and teacher work together to arrive at detailed objectives appropriate to the student's plans, learning ability and potential. Their next step is to select instructional methods and materials geared to these objectives from a complete file of study units specially assembled for Project PLAN. At the completion of each unit, the student's performance and progress are evaluated, and the next set of units assigned.

The student thereby proceeds at his own pace on a course of study created to fill his particular needs.

This individualization of education is made possible by the use of the computer as an information processing, storage and retrieval tool. Stored in the computer is detailed information on each student participating in Project PLAN —

what he knows, how he learns, his interests, potentials and plans. Available from the computer on a daily basis is the comprehensive "teaching-learning units" file from which his individual study plan is built, as well as programs for scoring, analyzing and reporting his progress.

The system is completely flexible, designed to be installed in today's schools, and to be implemented in current classroom facilities. The major piece of equipment involved, the computer, is located at the A.I.R. headquarters in Palo Alto, California, and connected directly to the schools via individualized terminals.

The Center for Programmed Learning for Business of the University of Michigan Graduate School of Business Administration has scheduled the second of its summer **Instructional Design Workshops** for August 13-18, 1967.

This workshop will be of special benefit to instructors, training coordinators, on-the-job trainers, training consultants and others charged with the responsibility of designing courses.

For detailed information about registration and room reservations write the Registrar, Center for Programmed Learning for Business, 340 South State Street, Ann Arbor, Michigan 48104.
